

pump suction side inlet that has provisions for also receiving input from a chemical agent storage tank.

Applicant has clarified the instant independent claims to indicate that the pump is a standard pump that includes a water manifold inlet. Further, the fitting through which the additive is ported is established upstream of the pump water manifold inlet. The water manifold inlet of a standard pump is illustrated as manifold fitting F2 in Figure 2, manifold F4 in Figure 3 and the equivalent unlettered manifold fittings in Figures 4 and 5. Applicant points out on page 5, line 26 of the specification that standard pump P comes with fitting F2.

Respectfully submitted,
